

Advance Deposit Tracker — Formula Confirmation Questionnaire

Version 1.0 · 07 July 2026 · Companion to the “Formula & Calculation Reference” (v1.1)

Six alignment questions discovered while documenting every formula in the system. Nothing here blocks day-to-day use — your answers let us finalise the remaining details.

How to complete: tick an option or write your preference in the answer box under each question.
Question 5 also feeds the pending CR8 (auto-flagging) discussion.

Question 1 — Retired configuration parameter

The old Cost of Fund formula used a 30-day grace window counted from the payment date (`cost_of_fund_grace_days`). The revised formula (07-Jul-2026) measures delay from the Grace ETD instead, so this parameter no longer affects anything.

OK to remove it from the configuration screen to avoid future confusion?

☐ Yes, remove it ☐ No, keep it visible

NOTES

Question 2 — Grace period wording

A few on-screen hints still say the grace period defaults to "7 days"; the actual configured value is **10 days**. We will correct the text to 10.

Please confirm 10 calendar days remains the agreed grace period.

☐ Confirmed — 10 days ☐ Change it to: _____

NOTES

Question 3 — “Contribution %” basis differs by tab

On the analytics breakdowns, the By-Merchandise tab computes each row's Contribution % as its share of the overdue *USD amount*, while the By-Vertical and By-Customer tabs use share of the overdue *case count*.

Should all three tabs use the same basis — and if so, which one?

☐ All by amount ☐ All by case count ☐ Keep as is

NOTES

Question 4 — Cross-currency “Total Deposit” cards

The system never converts currencies. However, two drill-down summary cards add USD + CNY + EUR deposit amounts together into one raw number labelled USD.

Prefer per-currency figures on those cards, or keep the raw combined total?

☐ Split per currency ☐ Keep combined total

NOTES

Question 5 — Auto-flag sensitivity (links to CR8)

Currently, any request that goes even **1 day** past its Grace ETD automatically flags its supplier as defaulted (~129 suppliers are actively flagged today). Every future advance to a flagged supplier then requires Head-of-Merchandise approval.

Should there be a higher threshold — e.g. flag only beyond N days overdue, or only after M overdue requests?

☐ Keep 1 day ☐ Flag after ____ days overdue ☐ Flag after ____ overdue requests

NOTES

Question 6 — Delay-bucket boundary at exactly 1 day

In the aging analysis, a request exactly 1 day overdue sits on the boundary between the "Graced ETD" bucket and the "G-15 Days" bucket (the backend and the screen apply the edge slightly differently).

Which bucket should a 1-day delay belong to?

☐ Graced ETD ☐ G-15 Days
